

Corto #10 Cálculo Integral (15 min)

Nombre: <u>David (0130</u> Carnet: <u>20140432</u>

1. Considere la curva dada por las ecuaciones paramétricas:

$$x = 2 + t \cos t$$
$$y = t^2 + 2t + 1$$

- (a) (50 pts.) Encuentre la derivada $\frac{dy}{dx}$.
- (b) (50 pts.) Encuentre la ecuación de la recta tangente a la curva en t=0.

$$= \frac{y^{s}(t)}{x^{s}(t)} = \frac{\frac{1}{d(t)}\left(t^{2}+2t+1\right)}{\frac{d}{d(t)}\left(2+4\cos(t)\right)} = \frac{2t+2}{\cos(4)-t\sin(4)}$$

$$\frac{y^{3}(0)}{x^{3}(0)} = \frac{2(0) + 2}{\cos(0) - 0\sin(0)} = \frac{2}{1} = \boxed{2}$$

$$\frac{x(0) = 2 + 0\cos(0)}{x(0) = 2}$$

$$\frac{x(0) = 2}{x(0) = 2}$$

$$\frac{x(0) = 2}{x(0) = 2}$$

$$\frac{x(0) = 2}{x(0) = 2}$$
